### Summary

Frontend Engineer with 5 years of experience building and maintaining production web applications with React, Vue, TypeScript, and modern frontend tooling. Experienced in frontend architecture, complex business logic, API integration, state management, performance, and automated testing. I work closely with backend and product teams to turn complex requirements into maintainable user-facing systems, with particular experience building subscription, pricing, and commerce workflows.

---

### Experience

## Front End Engineer

Law Pavilion Business Solutions • Lagos, Nigeria
09/2021 - Present

- Build and maintain production web applications using Vue 3, React, Next.js, TypeScript, Pinia, and REST APIs across customer-facing and internal products.
- Architected a config-driven plan migration system that replaced hardcoded subscription migration logic with reusable rules for product, plan, addon, and target-plan combinations.
- Extracted complex subscription business logic into framework-independent TypeScript utilities for plan migration, feature comparison, feature diffing, and upgrade verification.
- Built a plan comparison system that transforms API feature data into categorized comparison matrices, with subscription-aware actions for current, upgradeable, unavailable, and new plans.
- Implemented feature-diff logic that identifies inherited, newly available, and removed features across subscription tiers using stable feature matching.
- Built a prorated subscription-extension flow that handles addon purchases, remaining license periods, pricing returned by the API, and license-expiration updates.
- Added automated unit tests covering 28 business-logic cases across migration rules, pricing calculations, feature comparison, feature differences, and upgrade verification.
- Handled subscription edge cases including annual-to-lifetime purchases, expired subscriptions, upgrade eligibility, prorated pricing, and downgrade prevention.
- Integrated complex checkout state through Pinia, keeping product selection, subscription state, and derived upgrade information separated appropriately between global state and local computed state.
- Worked with backend engineers to integrate pricing and subscription APIs and translate API data structures into customer-facing purchase flows.
- Advocated for decoupling the Store frontend from its Laravel monolith as the backend expanded to serve multiple applications; rebuilt the client in Vue 3 with Pinia in a separate repository.
- Implemented server-side rendering and static generation with Next.js to support SEO and frontend performance.
- Built internal dashboards for addon sales, publisher remittance tracking, and account-manager follow-up workflows.
- Helped design and implement an addon manager that allowed irregular conference-driven plans to become purchasable addons within the Store application.
- Integrated product analytics using PostHog alongside existing analytics tooling.

## Frontend Developer

Softamos Global Services Limited
03/2024 - 12/2024

- Developed and maintained production e-commerce applications using TypeScript and modern frontend practices.
- Refactored legacy frontend code to improve maintainability and performance.
- Integrated third-party APIs and payment gateways into customer-facing applications.

- Built responsive UI features and collaborated with backend and other cross-functional teams to deliver product requirements.

---

## Selected Projects

**KreKre — URL Shortener (Frontend | API Backend)**
*Ruby on Rails · React · TypeScript · PostgreSQL · RSpec · Rack-Attack · Solid Cache*

- Built a Rails API backend using test-driven development, with RSpec covering core business logic and edge cases.
- Implemented URL normalization and fingerprinting to identify duplicate URLs and return existing short URLs instead of creating duplicates.
- Built collision-resistant slug generation backed by database-level uniqueness constraints.
- Added request rate limiting with Rack-Attack and caching to reduce repeated external IP geolocation requests.
- Set up CI with automated RSpec tests and Brakeman security scanning.
- Building the React/TypeScript frontend to consume the API and present URL analytics.

**Jobifiy — HR & Recruitment Platform (Jobifiy)**
*React · TypeScript · Tailwind CSS · REST APIs*

- Built the core frontend architecture and functionality for the initial release of a recruitment platform.
- Implemented an applicant tracking workflow with drag-and-drop movement between recruitment stages.
- Built employer-candidate messaging and automated job assessment functionality.
- Designed responsive interfaces for recruitment dashboards and mobile job seekers.

**TECNO Camon 20 Promotional & Competition Platform**
*React · Tailwind CSS · REST APIs · Vercel*

- Built a responsive landing page and competition submission system for a nationwide product launch campaign.
- Implemented a real-time leaderboard to display participant rankings.
- Optimized frontend rendering and performance for mobile users.
